EDUCATION

B.Tech in Cybersecurity
Dayananda Sagar University, Bengaluru
Aug 2024 – Jun 2028 (Expected)
CGPA 7.5 / 10.0

Coursework: Introduction to Cybersecurity, AI in Cybersecurity, DBMS, Computer Networks

PROFESSIONAL SUMMARY

I'm a second-year Cybersecurity undergrad who treats research and engineering as the same discipline. My work moves between reading standards (NIST SP 800-207, CISA ZTMM v2) and turning them into things that run — CLI tools, deployed web apps, mobile auditors.

The through-line is measurable trust: scoring how exposed a network is, grading an organisation's zero-trust maturity, quantifying how likely a prompt is to be an injection. I care about correctness over shine, and about being honest when a metric is too good to be true.

PROJECTS

PromptGuard — FastAPI · React · TypeScript · XGBoost · scikit-learn
Prompt-injection risk scorer for LLM apps

- FastAPI risk-scoring service with a React + TypeScript frontend and an XGBoost / scikit-learn backend.
- Trained on Hugging Face prompt-injection data plus synthetic adversarial prompts generated locally with DeepSeek-R1 1.5B on Ollama.

87.08% accuracy **85%** injection recall **95%** precision

https://github.com/BrownJesus69/promptguard

SME-ZT CLI — Python CLI · CISA ZTMM v2 · NIST SP 800-207 · CSA SMB
Zero-trust maturity assessment for small & medium enterprises

- A five-pillar, five-level maturity model aligned to CISA ZTMM v2, NIST SP 800-207 and CSA SMB guidance.
- Weighted scoring with Level-1 capping logic to stop over-scoring, plus detailed textual self-assessment reports.
- Validated against three documented SME breach case studies and folded into the published manuscript.

https://github.com/BrownJesus69/zt-maturity-sme

MUN Argument Builder LIVE — FastAPI · Groq API · Llama 3.1 70B · Render
Deployed argument engine for Model UN delegates

- Generates structured arguments, counter-arguments, evidence prompts and fallacy checks on demand.
- FastAPI backend on Groq's Llama 3.1 70B, with GitHub-triggered auto-deploy on Render.
- Custom domain via GoDaddy and TLS via Let's Encrypt.

https://quantumpandits.com https://github.com/BrownJesus69/mun-argument-builder

NetworkAudit — React Native · Expo SDK 54 · TypeScript · Express · Zod · Neon PostgreSQL
Real-time Wi-Fi & hotspot security auditor for Android

- Scans the connected network live and computes a 0–100 security score with an A–F grade.
- Flags CVE-based findings: default gateway IPs, single DNS server, external-DNS logging risk and SSID identity leakage.
- Full-stack: RN + Expo client, Express + Zod API, Neon PostgreSQL, EAS Build on Render.

NutriLog PostgreSQL · BCNF schema · Frontend · Docs
Relational dietary-logging system

- Owned the frontend, documentation and application logic for a PostgreSQL nutrition tracker.
- Correctness-oriented design grounded in a BCNF-normalised schema.

https://github.com/sampratigaurav/nutrilog

EXPERIENCE

Cybersecurity Intern Jun 2026 — Present
Arova Fitness

- Conducted authorized pentest on arovafitness.com and REST API (api.arovafitness.com) using Kali Linux and Burp Suite Community Edition — DNS/WHOIS recon, TLS review, HTTP header analysis, gobuster directory enumeration, and JavaScript bundle reverse-engineering to uncover an Express.js backend behind Cloudflare and map CORS preflight exposure on authentication-gated endpoints.
- Parsed OpenAPI specification to catalog 86+ production endpoints across External API, Gym Panel API, and Fitness API services (73 JWT-authenticated, 18 unauthenticated, 22 AI-backed); produced a 352-route API surface map and structured findings reports covering open ports, service versions, and endpoint-level vulnerabilities.
- Completed two assessment phases yielding 16 total findings (5 Phase 1 unauthenticated, 11 Phase 2 authenticated), including two Critical-severity vulnerabilities — premium plan escalation via PUT /api/user/plan and OTP invalidation flaws — validated via IDOR-style token-swapping and Hoppscotch functional test cases.
- Architected 192-row exercise library (100 Warmup + 92 Cardio, 12-column schema); built Python/openpyxl data pipeline and Google Apps Script automation to bulk-rename and organize image assets in Drive with lowercase-underscore-numbered convention, validating the platform's live admin category system.

RESEARCH & PUBLICATIONS

Zero Trust Maturity Assessment Framework for Small and Medium Enterprises (SME-ZT) Co-author

A five-pillar, five-level maturity framework with SME-specific weighting and Level-1 capping to prevent over-scoring, validated across three breach case studies.

Security Threats and Countermeasures in IoMT ML-driven Healthcare Systems Co-author

Survey of ML-based IoMT intrusion detection, federated learning, privacy preservation and layered defences against malware, DoS and adversarial attacks.

Deepfake Media Analysis: A Survey on Detection Techniques and Open Issues Co-author

Review of deepfake generation methods, benchmark datasets, detection techniques and the surrounding ethical and legal frameworks.

A Baseline Simulation Framework for DDoS Attack Detection in IoMT Networks Lead author

Wrote and formatted the full manuscript; showed that 'perfect' metrics on synthetic data arise from trivial one-dimensional separability in the SYN ratio.
